Leg Hairs

COMFORT
PAINLESS
RELEX
& FAST

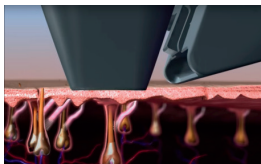

This service also reduces in-growths. We recommend five to seven sessions in order to see optimal results.

While the majority of people see up to 90% permanent hair growth reduction, fluctuating hormones can make hair grow back for some clients.

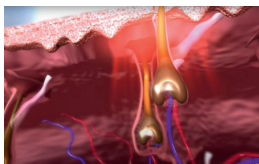

A maintenance session every once in a while is recommended as per consultation.

WORKING PRINCIPLE

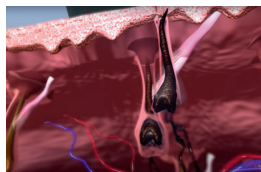

Laser Hair Reduction works on the principle of eliminating hair follicles with pulses of laser light to reduce hair growth in unwanted areas.

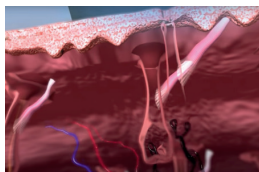

Contact

Selectively Thermal Damage

The hair follicle and hair shaft are damaged by thermal absorption

Hair lose the primary environment

Triple wavelength laser combines the synergy of three wavelengths 1064, 810 and 755 nm. Out of these three, 1064 and 810 nm have potential for deep penetration and hence focus on darker skin tones. Wavelength 1064 nm can be particularly useful for areas such as armpits and pubic area. Wavelength 810 is often used for areas such as arms, legs, and cheeks whereas 755 nm is useful for eyebrows and upper lip areas.

PROCESS OF HAIR REMOVAL

The client meets with our doctor in order to assess hair growth, areas of treatment and number of session required.
